

SERVICE BRIEF

VMware Virtualization Services

Modern services for modern business practices.

Virtualizing Your IT Infrastructure

Simplify the way your technology operates without sacrificing the processing power and performance that you require.

VMware virtualization software offers several benefits for a business seeking to be at the forefront of their respective industry. By signing on with Eclipse Integrated Systems, you can enjoy the benefits of VMware virtualization, including:

- **Slashed Costs:** By decreasing the number of machines running, your business becomes more energy efficient, accomplish the same amount of work with less operational costs.
- **Improved Business Continuity:** By having your infrastructure in one centralized virtual environment, your business can be prepared for the worst.
- **Simplified Database Management:** Manage all of your databases and mission-critical applications from one convenient location, allowing your business to meet deadlines as quickly and efficiently as possible.

Consolidate Space and Resources with Virtualized Servers

Did you know that most servers are underutilized?

If your business is running separate servers for each of your different applications, there's a good chance that you aren't using your servers to their full capacity. This can lead to a complex network made up of several different servers spread out over a large infrastructure. This wastes both physical space and energy resources. Eclipse Integrated Systems can cut out these underutilized servers and run multiple applications, or even

operating systems, on the same server. This presents a solution that allows your organization to save space, capital, and assets.

Streamline Operations with a Virtualized Network

A virtual network is just like a physical network, only better.

Unlike a physical network, which demands rigorous attention and maintenance, a virtual network can automate tasks and maintain itself, offering support for both the latest titles as well as essential legacy applications. Virtual networks offer the reliability and connectivity you've come to expect from your physical network, but with greater versatility and built-in management.

With virtual networks, you can manage your networks the same way you would your current network, but with a degree of greater flexibility. Scalable computing networks provide for all the activities and functions you need addressed; at the same or improved speeds.

Increase Mobility with Virtualized Desktops and Applications

Mobility is everything to the modern business.

With virtual desktops and applications, your employees can access their work desktops whenever they need to, from any device. This flexibility allows you to enjoy secure, scalable virtual desktop solutions that help your business stay competitive. Being able to access your applications while on the go can be a game-changer for businesses. The extra mobility and increased productivity can be just what your business needs to pull ahead of your competitors in whatever market you are in.

Features

- Streamlined server usage, permitting multiple applications or operating systems to run on the same server.
- All the benefits associated with a physical network, with improved versatility and self-management—including automation and scalability.
- Improved mobility through the ability for employees to access their systems and applications through virtualized desktops and applications.
- Support for all solutions, including the latest software titles and business-essential legacy applications.

Benefits

- Decreased operational costs
- Contributes to business continuity
- Makes database management easier
- Consolidated physical infrastructure
- Hands-off automated network maintenance
- Scalability
- Enhanced mobility
- Increased productivity
